

Conical Sealing Plug 4 pipes

Application

The **Conical Sealing Plug** needs to be pulled over the pipe before insertion. Lubricant helps to slide the pipe through. When the carrier pipe is in its final position, the plug is pushed into the annular space by hand. The plug can be lightly hammered into its final position. Do not smash the plug collar into the casing.

Material

Rubber: EPDM black
Durometer: 40 \pm 5 Shore A (extra soft)
Height incl. collar: 50 mm

Other material qualities on request.

All plug sizes can be cut on-site using a sharp knife to allow retrofit application. One cut is enough.
